Project Name: Rogue Swordsman

Project Synopsis: Rogue Swordsman is a turn-based fantasy roguelike where players fight through a procedurally generated dungeon, collecting loot and relics, to defeat a final boss.

(To Be) Implemented in Sprint 1 (52 pts)

#14 Combat loop with win/loss, basic attack only (13)
#15 Enemies as data resources (5)
#16 Swordsman health in HUD (3)
#47 Combat UI: health bars, attack button, turn indicator (3)
#60(new): Hardcoded straight-line map (~3)
#4 Map screen display (5)
#5 Map highlights, visited nodes, icons (3)
#6 Sprite travel along the map (3)
#53 Main menu (2)
#55 Death screen (3)
#56 Victory screen (2)
#57 HTML5 export and public link (5)
#59 Resizable window (2)

Not Implemented
Basic Implementation

Sprint 2 Requirements (49 Total):

#1 Map generator builds 8-10 tiers with 3-4 lanes from a seed, forward-only connections, no crossing paths, and a single boss node at the top. **(13)**

When the game is started a random seed should be generated that creates a node-based lane map with 8-10 tiers, 3-4 lanes per tier. Every map includes the boss node at the end of the highest floor. The same seed always gives the same map, so runs can be retried or shared by map. Node types are covered in other stories and some weighted rolls for selecting them.

#2 Path validation and repair ensure no orphaned nodes, every node is reachable from a start node, and every node leads to the boss. **(8)**

After generating a map check to make sure it is not broken in some way relating to the pathing. Fix invalid pathing such as disjoint nodes, orphaned node or unreachable node. Repair makes sure that the nodes are given a connection to satisfy these rules.

#3 Map nodes are assigned a type (fight, shop, rest) by weighted rolls with constraints (at least one shop, a rest node always precedes the boss, no two shops in a row). **(5)**

Each node is given a type using weighted rolls to make sure they are in the right place and at the right balance. Fights are most common, shops and rest are less common but have some guaranteed positions for game balance. Weighted rolls ensure that they are put in the right place and not too few or many of a type exist.

#7 Map seed is displayed on screen, and the same seed regenerates the same map. **(1)**

Requirement 1 is about making seeds work, this requirement is about displaying the seed and ensuring that using the same one gives the same map. Showing the player the seed ensures they can reuse it if wanted to retry a run or compare their run to somebody else's.

#17 Turn order is determined by each combatant's speed stat. **(3)**

Speed stat determines who’s turn it is at the beginning of combat, higher speed starts. Ties are resolved consistently, intend to give to player.

#18 Energy system gives each skill an energy cost, lets the player use multiple skills per turn until energy runs out, and refills energy at turn start. **(3)**

Energy system implemented which is the resource for using skills. Players can use skills, decrementing energy until they run out and then they must wait for next turn to use skills. The turn ends when energy runs out, and refills at the start of the next turn.

#19 Cooldown system locks a used skill for a set number of rounds (1 round for basic attack and block, more for stronger skills). **(3)**

Skills have a cooldown system attached which limits their rapid use. Basic skills may be usable every turn, but stronger skills require multiple turns to pass to be used again, despite having the energy to use them. Skills on cooldown are clearly shown with counters for how many turns until they are available again.

#26 Killing enemies awards XP and gold **(2)**

When the player defeats an enemy, xp and gold are rewarded. Tougher enemies yield more resources.

#31 Defense branch: Block skill grants a temporary shield that absorbs damage for low energy and a 1-round cooldown. **(2)**

In the defense skill branch there is the block skill. Block gives a temporary shield that absorbs damage at low-energy cost with a 1 round cooldown. Treated as temporary hp that takes damage first before health does, and fades if not used before skill timer is up.

#35 Big Hit branch: Heavy Strike skill deals increased damage for high energy and a multi-round cooldown. **(2)**

In the big hit skill branch there is the heavy strike skill. Heavy strike is a supercharged version of a basic attack, having increased damage and a multi-round cooldown. High energy cost+cooldown so strategy is needed to decide when to use it.

#37 Enemy intent (next action) is shown above the enemy before the player's turn. **(2)**

The next action that an enemy is planning to take should be shown. Allows player to strategize skill-use to maneuver around enemy actions.

#38 Grunt enemy with a balanced attack pattern. **(2)**

Grunt enemy is the most basic enemy you face at the start of the game. Simple and predictable attack pattern for straight-forward, standard combat.

#39 Brute enemy with high health that attacks once every turn. **(2)**

Brute enemy is similar to grunt but sports higher health. A more advanced enemy but still not an elite unit. Simple, straight-forward attacks, mostly just attacks.

#51 Current gold total is displayed in the HUD. **(1)**

Player’s current gold total is always visible and updates as earned from defeating enemies or spent in shop.
